

Provet Cloud 2.3 Release Notes

Developments

- Added check-in and check-out reason types to boarding events. Initially accessible to beta-testing cloud environments only and will be extended to a wider audience in subsequent phases.

Fixes and improvements

- Fixed loading users table.
- Fix options rendering in token input select, if dependent on value in other token input select, ex. options in patient select after client value has changed.
- Loading the scheduled appointments on the dashboard has been optimized.
- Fixed an issue where draft bundles appeared in super search results.
- Fixed an issue with linked appointments where the child appointment was not updated when the client and patient were changed in the parent appointment.
- Dismissed batches on the batch collection can now be added to the stock.
- Fixed an issue where the order form link did not appear in the dialog after sending a referral on a laboratory referral page.
- When a payment card is removed from a client and the client has no email set, active health plan subscriptions are now set as suspended. If the client has an email set, the subscriptions switch to Provet Billing which sends invoices to the client via email at the end of each month.
- Text templates and form templates created in the central department can only be edited in the central department. Existing templates are considered as created in a non-central department. Initially accessible to beta-testing cloud environments. Extended to a wider audience in subsequent phases.
- Fixed an issue where a microchip implementation date that had been saved before was not shown when the microchip edit dialog was opened.
- Adjusted the filters on the user management page to better handle scenarios that involve many departments or department groups.

- When laboratory gateway authentication fails, the error message now only shows the error description without the credential information.
- Remove requirement to lock forms in order to enable E-signature functions.
- Fixed an issue with a wrong VAT of Pharmaca Fennica items. Pharmaca Fennica items now always have 10% VAT and will be available to be dispensed or administrated on a consultation.
- A search field has been added to the department switcher, and the user's home department is shown at the top of the list. Initially accessible to beta-testing cloud environments. Extended to a wider audience in subsequent phases.
- The estimate item price accuracy has been improved. In some cases, it was incorrect when a price range was not used.
- Fixed the total calculation that was wrong for specific VATs in the Records > Invoices export.
- Fixed an issue with estimates where the user could not update the minimum quantity in certain cases.
- Created API endpoints for the import file upload.
- Added support for importing the administration method and drug strength fields when importing items via "Import from lists". Note that values for these fields come from the wholesalers and that the field values are not visible during the import.
- Fixed a bug where adding a medicine instruction template erased changes made to the medicine item.
- Fixed an issue where some IDEXX VetConnect PLUS results were not added to Provet Cloud.
- Fixed a bug where client tags were automatically added to a new client created from the "New appointment" dialog.
- Fixed an issue where a batch number requirement error occurred mistakenly when updating items using the file importer.
- Fixed an issue where duplicate rows were shown for some items in the stock level report.

Database schema changes

- billing_paymentcard
 - New column `created` [datetime(6) NULL].
 - New column `modified` [datetime(6) NULL].
- formbuilder_formtemplate
 - New column `created_department_id` [integer NULL].

- Foreign key reference from `created_department_id` to `organization_department`.`id`.
- health_schedulingevent
